

ABSTRACT OF THE DISCLOSURE

A method and system for securely transferring data between an application server and an agent of the application server through a non-secure node. First, a session key between the agent and the application server is established by utilizing a public key of the application server that is embedded in the code of the agent. Next, an end-to-end secure connection is established between the agent and the application server by using the session key and by establishing a communication link between the application server and the non-secure node by using a relay module.
